

Improve on the positives
(analyze self and opposition)

The **Liberal Party** won the elections

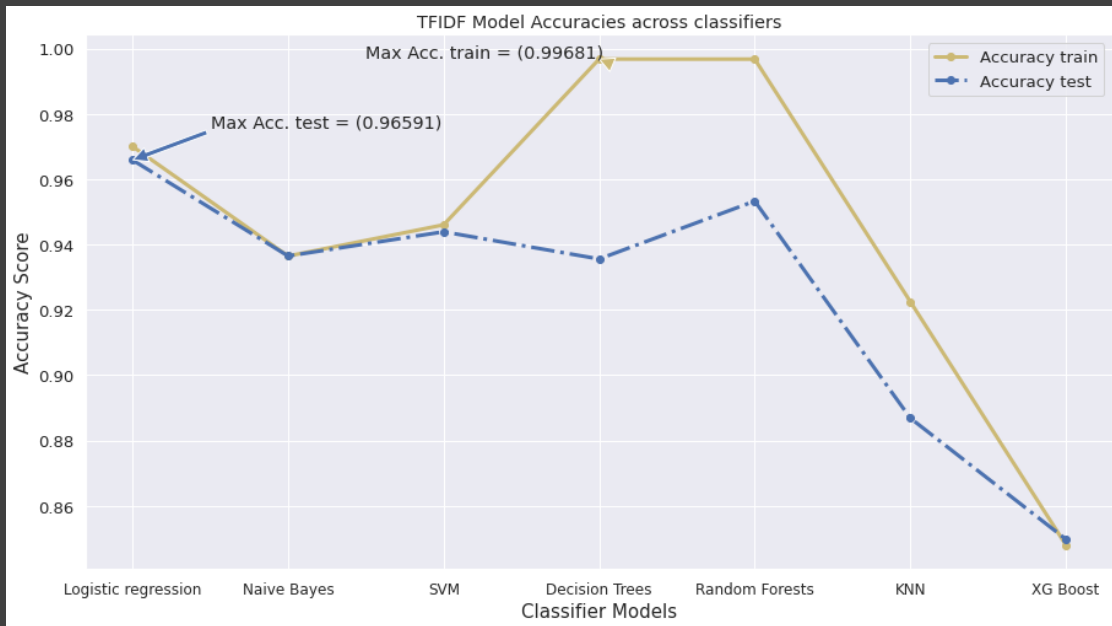

Work on the drawbacks critically

Understand positive sentiment among the people

What are the negative perception?

Analyze the causes of negativity

Line Graph

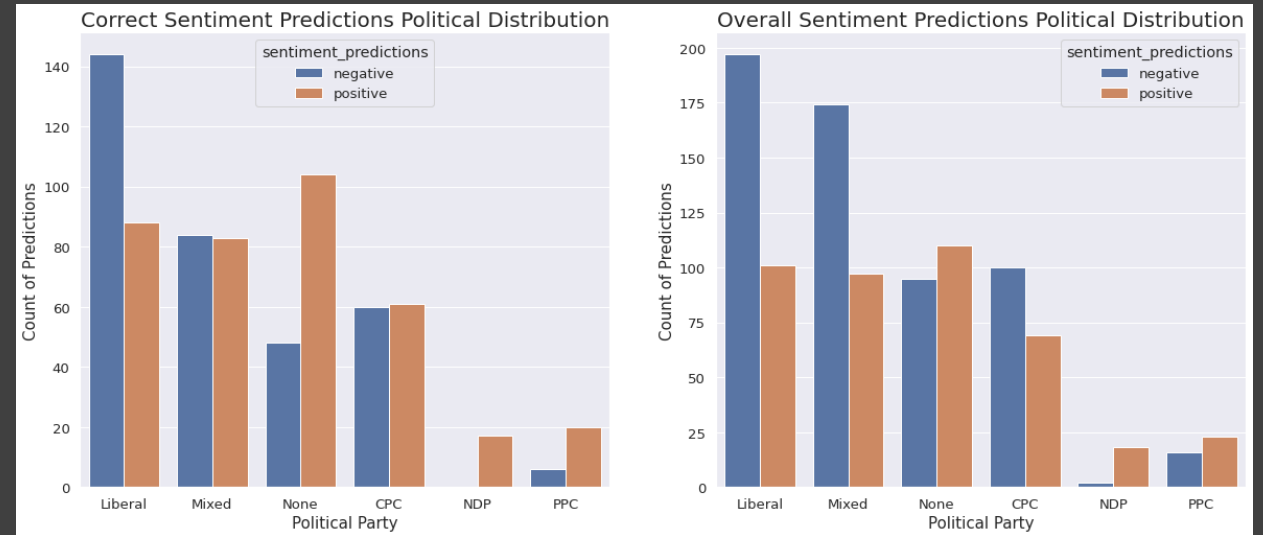

Results of the model performance achieved in the various machine learning model.

Best performing model Logistic regression (acc = 0.965).

Final accuracy on Election data is lower (acc = 0.71)

Drawbacks: Election keywords missing in generic dataset

- **Liberal Party** and **Conservative party** two largest parties have higher proportion of negative sentiments
- **Liberal party**: highest positive predictions (based on generic dataset trained model)
- Actual result : Liberal party won the election

NLP or Natural language Processing either through tweeter or any social media platform gives a great idea to analyze the sentiment of the large demography across any given region, thus helps to predict possible correct consequences of any upcoming event like elections.
